Package 'RcppSpdlog'

May 9, 2025

```
Title R and C++ Interfaces to 'spdlog' C++ Header Library for Logging
Version 0.0.22
Date 2025-05-09
License GPL (>= 2)
Description The mature and widely-used C++ logging library 'spdlog' by Gabi Melman provides
     many desirable features. This package bundles these header files for easy use by R packages
     from both their R and C or C++ code. Explicit use via 'LinkingTo:' is also supported. Also
     see the 'spdl' package which enhanced this package with a consistent R and C++ interface.

exampleRsink spdlog Example using a sink for R

Description

A simple example invoking a derived R/Rcpp logger. Also demonstrates the stopwatch feature. For more features see the 'spdlog' documnetation.

Usage

exampleRsink()

Details

Note that this no longer triggers R warnings thanks to excellent help by Gabi Melman.

Value

None

Examples

exampleRsink()

get_stopwatch

formatter

Simple Pass-Through Formatter to fmt::format()

Description

The C-level interface of R does not make it easy to pass ... arguments. This helper function assumes it has already been called with format() on each argument (as a wrapper can do) so it just spreads out the class to fmt::format{} which, being C++, uses variadic templates to receive the arguments. The main motivation for this function to able to format string as use by the 'fmtlib::fmt' library included in 'spdlog' to write similar debug strings in both R and C++. This function permits R calls with multiple arguments of different types which (by being formatted on the R side) are handled as strings (whereas C++ logging has access to the templating logic).

Usage

```
formatter(s, v)
```

Arguments

s A character variable with a format string for 'fmtlib::fmt'

v A character vector with the logging string arguments.

Value

A single (formatted) string

get_stopwatch

R Accessor Functions for spdlog Stopwatch

Description

A set of functions provides access to the spdlog stopwatch facilty. As stopwatch object is a simple container around a C++ std::chrono object which (essentially) reports elapsed-time since creation. The object is exported to R via an external pointer permitting use from both R and C++.

get_stopwatch 5

Usage

```
get_stopwatch()
elapsed_stopwatch(sw)

format_stopwatch(sw)

## S3 method for class 'stopwatch'
print(x, ...)

## S3 method for class 'stopwatch'
format(x, ...)
```

Arguments

sw An S3 object of type stopwatch.
 x An S3 object of type stopwatch.
 ... Dotted argument required by generic, unused here.

Details

Several functions are provided:

```
get_stopwatch Returns a stopwatch object (as an S3 object).
elapsed_stopwatch Returns elapsed time for stopwatch in seconds.
format_stopwatch Returns elapsed time for stopwatch as character variable.
```

The stopwatch object has print and format methods.

Value

The desired object is returned: respectively, a stopwatch object as an external pointer in an S3 class, the elapsed time in seconds as a double, or formatted as a character variable.

Examples

```
w <- get_stopwatch()
Sys.sleep(0.2)
elapsed_stopwatch(w)
format_stopwatch(w)</pre>
```

6 log_setup

log_setup

R Accessor Functions for spdlog Logger

Description

Several R-level functions can access the spdlog logging facilties. As spdlog is a C++-level logging library, these are R function permit concurrent logging from both R and C++.

Usage

```
log_setup(name = "default", level = "warn")
log_init(level = "warn")
log_filesetup(filename, name = "default", level = "warn")
log_drop(name)
log_set_pattern(s)
log_set_level(s)
log_trace(s)
log_debug(s)
log_info(s)
log_warn(s)
log_error(s)
log_critical(s)
```

Arguments

name	A character variable with the logging instance name, default value is 'default'.
level	A character variable with the default logging level, default value is 'warn'.
filename	A character variable with the logging filename if a file-based logger is instantiated.
S	A character variable with the logging pattern, level or message.

Details

Several functions are provided:

log_setup Initializes a logger (which becomes the default logger).

setLogLevel 7

log_filesetup Initializes a file-based logger (which becomes the default).

log_drop Removes logger (which in general should not be needed).

log_set_pattern Changes the default logging message pattern.

log_set_level Sets the logging level threshold.

log_trace Logs a trace-level message.

log_debug Logs a debug-level message.

log_info Logs a info-level message.

log_warn Logs a warn-level message.

log_error Logs a error-level message.

log_critical Logs a critical-level message.

Supported logging levels are, in order of increasing threshold values, 'trace', 'debug', 'info', 'warn', 'error', and 'critical'. A message issued below the current threshold is not displayed whereas a message at or above the current threshold is displayed. The default level is 'warn'.

Value

Nothing is returned from these functions as they are invoked for their side-effects.

See Also

The logging pattern format is described in at the repo in the page https://github.com/gabime/spdlog/wiki/3.-Custom-formatting.

Examples

```
log_setup("demo") # at default level 'warn'
log_info("this message is NOT seen")
log_set_level("debug")
log_info("this message is seen")
log_warn("as is this message")
```

setLogLevel

spdlog Logging Lever Setter

Description

A helper function to turn a logging level given as string into the current logging level

Usage

```
setLogLevel(name)
```

8 setLogLevel

Arguments

name

A string with the logging level. Value understood are, in decreasing verbosity 'trace', 'debug', 'info', 'warning', 'error', 'critical', and 'off'. Unrecognised names are equivalent to 'off'.

Value

Nothing is returned.
